The /usr/share/nginx/html/ is now writeable by the gcube user. It's the web server document root, so you must create the well-being subdirectory and put your html there. This is valid for every directory or file that not overlaps with the tomcat context names.

I did create a well-being folder under tomcat/webapps and put a sample index.html file but it isn't working

You have to create it under /usr/share/nginx/html/

I could move that directory under /home/gcube but I think that there's a higher risk that it could be accidentally deleted.

that's ok, sorry I misunderstood before.

Now we'd need to give permission to @lucapappalardo1984@gmail.com to upload files in that folder. I'm going to ask him to provide his SSH Public Key.
