Description

Hello, by chance would it be possible (if quick, easy and possible to do with existing hardware resources) to have a new directory on static-web.d4science.org?

At now we can deploy web files (through SFTP) on two directories named 'tunaatlas' (global tuna atlas https://tunaatlas.d4science.org/tunaatlas) and 'data-viewer' (WECAFC-FIRMS - http://wecafc-firms.d4science.org/data-viewer)

We would need a separate directory name 'faotunaatlas' that then could respond on the web to https://tunaatlas.d4science.org/faotunaatlas OR https://faotunaatlas.d4science.org/faotunaatlas

Thanks in advance
Emmanuel

Yes, it's doable. I'm going to configure the directory and the load balancer.

Done. You can access with your ssh key, the URL is https://tunaatlas.d4science.org/faotunaatlas
