The startup scripts are ready. They are upstart based because, with a manual installed tomcat, it's way easiers.

Inside the life home directory you'll find two scripts:

startContainer.sh
stopContainer.sh

Use them to start and stop the service.
As requested, I redirected the standard output and the standard error to catalina.out. I'm also providing a logrotate rule to daily rotate the catalina.out file and remove all the catalina logs older than 15 days.

It should be better to have a log4j.properties with proper settings for the rotation and removal of the old log files, though.

- *Status changed from Feedback to Closed*

The startup script is working.
